

DSE ERP

PDF Studio Guided Mapping Guide

Version 10.0.25 - Simplified Guided Mapping UI

Step-by-step instructions for untrained users to map the Standard Sales Invoice safely, preview real ERP data, validate, publish, and activate a Default template.

Safety rule: Save and Publish do NOT replace standard PDF generation. PDF Studio controls runtime output only after a validated template is explicitly activated as Default.

Ready | Template mapping is ready

Required mappings and page-flow safety are checked before final activation

1. Quick Start - the complete guided mapping sequence

1. Duplicate the standard template so the current active/default version remains unchanged.
2. Select a real Preview Record. This helps the Mapping Coach recognize actual values.
3. Click the existing printed PDF value. The Mapping Coach tells you the next step.
4. Search/select the matching ERP field and click Map. Do not place a free Text overlay on an existing value.
5. For Billing/Delivery Address and Terms, map one real source line; PDF Studio captures the connected lines automatically.
6. Use Detect Item Headers, then map each physical item column once.
7. Select the calculation grid and add Financial Summary. Do not map tax/charge rows individually.
8. Click Validate Mapping and clear every error. Preview both single and multi-page records.
9. Publish first. Use Publish & Set as Default only after Preview is correct.

Built-in help: click Mapping Guide PDF at any time. The application copies this guide to Downloads (or ERP Documents as fallback) and opens it in the system PDF viewer.

2. Simplified PDF Studio screen - what each area does

The normal mapping screen intentionally hides engineering controls. Most users only need the checklist, source PDF, Mapping Coach, Preview and primary toolbar actions.

Ready

Template mapping is ready

Required mappings and page-flow safety are checked before final activation

Area	Purpose
Top actions	Preview with Data, Save, Publish, Publish & Set as Default.
Primary mapping toolbar	Auto Map Fields, Detect Item Headers, Validate Mapping, Mapping Guide PDF, Fit Width / Fit Page.
Mapping Checklist / ERP Field Search	Shows required mappings and lets you search the ERP field catalogue.
Protected source PDF	Click the existing value/header/block you want to map.
Mapping Coach	Explains what you selected and tells you the next step.
Advanced Design (optional)	Only for a real correction requested by Preview/Validate: text/position, image, repeater sizing, or Auto Height/overflow.

3. What to click first - let the Mapping Coach teach the next step

- Click a changing PDF value, not its printed label. Example: click the invoice number value, not INVOICE NO.
- The Mapping Coach immediately describes the selected source object and recommends the next action.
- When Preview data strongly matches the source value, the coach can suggest the exact ERP field.
- For common item headers the coach recommends the exact item.* field, such as UNIT -> item.unit.
- For artwork/grid vectors, the coach tells you not to map them as normal fields. If it is the calculation grid, use Financial Summary.
- For a long address or Terms, the coach reminds you to map the first real line once, not line-by-line.

Normal users should not edit X/Y, fonts, padding, anchors or style internals. Those are behind Advanced Design and are only for a real Preview/Validate correction.

4. Normal fields - exact manual mapping action

- 10. Click the existing source value on the protected PDF.
- 11. Read the Mapping Coach instruction on the right.
- 12. Search/select the correct ERP field in Choose ERP field.
- 13. Click Map. Readiness is recalculated immediately.
- 14. Preview with real data after a logical section is complete.

Do NOT use a free Text object over an existing printed value. Existing source values should be replaced through source mapping so source position/style stays aligned.

Printed area	ERP field
Invoice No	document.number
PO No	document.poNumber
Invoice Date	document.date
PO Date	document.poDate
Billing customer name	party.name
Billing address	party.billingAddress
Billing GSTIN	party.billingGstin
Delivery customer name	party.name
Delivery address	party.deliveryAddress
Delivery GSTIN	party.deliveryGstin
Transporter	transport.name
Transport GSTIN	transport.gstin
Vehicle No	transport.vehicleNumber
Transport Contact	transport.contact

5. Billing / Delivery Address - map multiple source lines with one action

15. Click the first real address line inside the Billing section. Do NOT click the BILLING ADDRESS heading.
 16. Choose party.billingAddress and click Map.
 17. PDF Studio scans connected source fragments in that Billing block and combines them into one wrapped region.
 18. Map the Billing GSTIN separately to party.billingGstin.
 19. Repeat independently for Delivery: party.deliveryAddress and party.deliveryGstin.
- Address is configured as WRAP + Auto Height where safe.
 - Followers inside the same source flow block move at runtime when a longer address needs more height.
 - Runtime uses a copy; a long address never permanently changes the saved template.

If Validate warns that an address has less than two wrapped lines of initial space, select that mapped address, open Advanced Design -> Flow safety, keep Auto Height enabled and increase the initial height only enough to cover the intended address area.

6. Payment Terms and Terms & Conditions - map once

20. Payment Terms: click the source value/line and map document.paymentTerms.
21. Terms & Conditions: click the first actual condition line below the heading, not the heading itself.
22. Choose company.terms and click Map.
23. PDF Studio collects connected Terms lines into one wrapped block and keeps the heading/source artwork unchanged.

Do not map four printed terms as four ERP fields. ERP stores Terms as one value; map company.terms once.

7. Item Table - Detect Item Headers, then map each column once

- 24. Create/select one Item Table repeater covering the item-body area.
- 25. Click Detect Item Headers in the primary toolbar.
- 26. Click each physical source header. The Mapping Coach recommends the matching item.* key.
- 27. Map each detected physical column once. Never map individual item rows.

Physical header	ERP field
SR. NO.	item.serial
HSN CODE	item.hsn
PRODUCT DESCRIPTION	item.descriptionWithRemarks
QTY	item.quantity
UNIT RATE / RATE	item.rate
UNIT / UOM	item.unit
AMOUNT (INR)	item.taxable

If Validate says a header such as UNIT is not mapped, click that exact physical header, select the recommended item.unit field and Map. Do not create a Text overlay.

8. Item row capacity and alignment - let the source grid control geometry

- Detected header X position and width are the authority. Do not manually move item values until they look close.
- The Item Table body should start below the header and end above the Bank/Financial section.
- If Validate reports very small page capacity, select the Item Table and open Advanced Design -> Item / Charge table sizing.
- Adjust Row Height / Header Height only when Validate reports a real capacity problem. Keep imported table/grid design enabled.
- Preview a single-item invoice first, then a 25+ item invoice. Final PDF Preview is the authority, not selection handles shown in Edit Mapping mode.

Only item.* fields belong in an Item Table. charge.* fields belong in the charge/financial area.

9. Calculation block - create one Dynamic Financial Summary

28. Click an empty/background/grid/border area of the complete calculation rectangle so the source calculation block is selected.
29. Open Advanced Create Tools (optional) and choose Financial Summary.
30. Confirm the Mapping Coach/selection hint says the Financial Summary is using the selected source block.
31. Do not map BASIC AMOUNT, DISCOUNT, FREIGHT, CGST, SGST, IGST, ROUND OFF row-by-row.
 - ERP controls Sub/Basic Total, Discount when present, all dynamic charges, Taxable Amount, CGST+SGST OR IGST, Round Off, and Grand Total.
 - The source template controls the block geometry/style.

If Financial Summary looks generic, remove it and repeat after selecting the real source calculation block first.

10. Bank, payment, amount words, signature and footer mappings

Printed area	ERP field
Company/Supplier GSTIN	company.gstin
Bank Name	payment.bankName
Branch	payment.branch
Account Number	payment.accountNumber
IFSC	payment.ifsc
Account Type	payment.accountType
Payment Mode	payment.mode
Payment Terms	document.paymentTerms
Amount in Words	totals.amountInWordsText
Grand Total (separate source value only)	totals.roundedGrandTotal
Terms & Conditions	company.terms
Authorized Signature	company.signature

Leave headings, borders, fixed labels, static logos and decorative artwork unmapped unless the value/image must actually come from ERP data.

11. Advanced Design (optional) - when you should use it

- Text / Position correction: use only if Preview shows a real alignment, text-fit, font-size or geometry problem. Source style/position is preserved automatically in normal mapping.
- Image options: choose/replace a mapped image and control fit/aspect ratio.
- Item / Charge table sizing: change row/header height only if Validate reports page-capacity problems. Leave detected columns unchanged.
- Flow safety: Auto Height is useful for Address, Payment Terms and Terms. Growth/Overflow should normally remain at values chosen automatically.

The old engineering controls - layer ordering, color/padding internals, raw anchor IDs, copy/paste format, page editing, duplicate Default controls, test-export controls - are intentionally not shown in the normal mapping UI.

12. Validate Mapping - how you know the template is ready

- 32. Use Mapping Checklist -> Required. Every required requirement must show MAPPED.
- 33. Use Fix Next Required to move to the next missing requirement.
- 34. Click Validate Mapping from the primary toolbar.
- 35. Use Review Issues to read all remaining errors/warnings. Clear every error before Publish/Default.

Issue	Correct response
Unmapped item header	Map the exact physical header to the correct item.* field.
Duplicate item binding	Correct one physical column; do not assign the same semantic field twice.
Address has too little initial height	Keep Auto Height and increase only the intended address region.
Item Table capacity too small	Correct repeater height / row height; preview a 25+ item record.
Unsafe source replacement	Do not hide it with an arbitrary overlay; use a safe editable source region.
Flattened/scanned source	Printed text is pixels; exact text-only removal is unavailable.

Target before activation: 13/13 (or all requirements for that document type), 0 errors, no unmapped physical headers, no duplicate bindings, and clean single/multi-page Preview.

13. Preview with real ERP data before Publish / Default

- 36. Use Preview Record on the right and choose a real ERP transaction.
- 37. Preview a single-item invoice. Check header values, party blocks, one item row, tax mode, amount words and totals.
- 38. Preview a multi-page invoice with enough items to force pagination. Confirm item rows remain in order and final calculation/footer blocks stay correct.
- 39. Check GST and IGST records. The same Financial Summary mapping must dynamically render the correct tax rows.
- 40. Check optional discount, charges, round-off, PO number and transport details.

10.0.25 acceptance used persisted UAT recovery records including a 1-item IGST invoice and a 27-item GST invoice with charges.

14. Save, Publish, Publish & Set as Default - safety contract

Action	What it does	Changes runtime PDF?
Save	Stores Draft / mapping changes.	NO
Preview with Data / Final PDF	Renders for checking.	NO
Publish	Creates a validated candidate snapshot.	NO
Publish & Set as Default	Certifies and activates the template for this document type.	YES
No active PDF Studio Default	Standard PDF generator remains authoritative.	STANDARD PATH

Do not use Publish & Set as Default until Validate is clean and both single + multi-page Preview are correct.

- DSE ERP 10.0.25 | PDF Studio Guided Mapping Guide | Keep this PDF open while mapping

16. Troubleshooting - quick user decisions

Problem	Correct action
I clicked a label instead of the value	Click the actual changing value and use the Mapping Coach; remove only the incorrect mapped object if needed.
Only first address line is selected	That is expected. Map it to Billing/Delivery Address; connected lines are captured automatically.
Terms heading got replaced	Remove that mapping and click the first real condition line instead.
UNIT header still errors	Click the physical UNIT header, select item.unit, Map, then Validate again.
Only 1 item row fits per page	Select Item Table -> Advanced Design -> table sizing; correct repeater/row height.
RATE / UNIT are swapped	Correct the physical header-to-ERP mapping; do not reorder source geometry.
Old source value still appears	Review validation/source replacement. Do not cover it with a random Text overlay.
PDF is scanned/image-only	Exact source-text replacement is unavailable; use a native/editable PDF or intentional clean-area overlay.
Published but standard PDF still appears	Publish alone is intentionally non-runtime. Explicit Default activation is required.

17. Printable final checklist

- ☐ Work on a Duplicate/copy when learning or changing an active template.
- ☐ Select a real Preview Record.
- ☐ Map Invoice No, PO No, Invoice Date and PO Date.
- ☐ Map Billing Name, Billing Address once, Billing GSTIN.
- ☐ Map Delivery Name, Delivery Address once, Delivery GSTIN.
- ☐ Map Transporter, Transport GSTIN, Vehicle and Contact.
- ☐ Create/select one Item Table and click Detect Item Headers.
- ☐ Map SR, HSN, Description, Qty, Rate, Unit and Amount once each.
- ☐ Select the complete calculation block and add Financial Summary.
- ☐ Map Bank/payment fields, Amount in Words, Terms and Signature as required.
- ☐ Use the Mapping Coach instead of guessing.
- ☐ Run Validate Mapping; resolve every error and review warnings.
- ☐ Preview a single-item transaction.
- ☐ Preview a multi-page transaction.
- ☐ Preview GST and IGST behavior.
- ☐ Save; close/reopen; confirm mappings persist.
- ☐ Publish (runtime still unchanged).
- ☐ Only after final checks: Publish & Set as Default.
- ☐ Generate again from the normal Sales workflow and compare with Preview.

If you are unsure what to do next: click the PDF value and read Mapping Coach. If you are unsure why Publish is blocked: click Validate Mapping / Review Issues.

Auto detection is a suggestion layer. Save Mapping applies your review; Cancel leaves the previous mapping unchanged.

 Mapping review

Review detected ERP mappings

Auto detection is a suggestion layer. Confirm, change, keep static or reset mappings here; source PDF geometry stays protected.

How to use the review popup

- 1. Review by section**
Header, Billing, Delivery, Transport, Items, Financial, Payment, Terms & Footer.
- 2. Check the ERP meaning**
Each detected PDF value/header shows the current ERP field and the original automatic suggestion.
- 3. Change only when needed**
Choose another ERP field from the dropdown. Item column X/width/alignment stay protected.
- 4. Confirm or keep static**
Confirm accepts the mapping. Keep Static leaves that source artwork/value unchanged.
- 5. Reset safely**
Reset Auto restores the detector suggestion. Confirmed/manual overrides are preserved on later re-detection.
- 6. Financial section**
Edit only block geometry, label/amount split, anchor and growth. ERP still decides GST/IGST/charges/rounding rows.
- 7. Finish**
Click Save Mapping, then Validate Mapping and Preview with real ERP data before Publish & Set as Default.

Status legend

A horizontal row of five colored buttons representing different mapping statuses: 'AUTO' (blue), 'CONFIRMED' (green), 'MANUAL OVERRIDE' (purple), 'REVIEW REQUIRED' (orange), and 'STATIC' (grey).

Tip: Auto Map, Detect Item Headers and Financial Summary all use this same centralized review workspace. No duplicate popup logic.

Print-friendly help page
